

My PGCert in AI e-portfolio

For my PGCert in AI course, I have built a basic e-portfolio and am hosting it on GitHub. Please access it via this link:

<https://willboltonai.github.io/>

I followed the basic guidance on the online learning environment from my course provider. I also had to do a considerable amount of self-directed learning to understand how to use GitHub and different Integrated Development Environments. I used GitHub training and YouTube videos, as well as other online resources to help direct my learning.

I used the template “html5up-escape-velocity” from <https://html5up.net/> because I liked the simple, yet smart design and it felt intuitive to navigate the pages. I customised it with some personal text and image details and added links to some of the coursework I have done so far.

After creating a new repository on GitHub, I followed the steps to turn on pages and uploaded the template. I then edited the files offline using Visual Studio Code because I really liked the interface and extension tools you could use. I then committed and synced to GitHub and ensured my site was live.

I have more to expand on it and will add reflections and further work as the course progresses. There is also the option to add more pages to the site if the content volume gets too large.
